CHARACTER AUTOMATIC

PURPOSE
Specifies a variable that is used as the arguments to the CHARACTER command.

DESCRIPTION
This command allows a variable to be used as the arguments to the CHARACTERS command. It is typically used with the CHARACTER OFFSET or CHARACTER ANGLE command to label plot points. The most common application is labeling bar charts with the data value, but it can be used in other ways.

This command is restricted to numeric values (it does not allow you to specify alphabetic strings). Also, the CHARACTER command is limited to 4 characters, which means that only the first 4 significant digits of the numeric values are printed (it is most typically used with integer values).

SYNTAX
CHARACTER AUTOMATIC <variable>
where the first element of <variable> specifies the character for trace 1, the second element specifies the character for trace 2, and so on for up to 100 traces.

EXAMPLES
CHARACTER AUTOMATIC Y
CHARACTER AUTOMATIC PRESSURE.

NOTE 1
Although the CHARACTER command can be used to label plot points, be aware that it has some serious limitations in this regard. The most important limitation is that character labels are limited to 4 characters. If you need more than 4 characters, you have to use the TEXT or LEGEND commands to specify the labels. However, this is more difficult since the coordinates for the TEXT and LEGEND coordinates are given in DATAPLOT 0 to 100 screen units rather than the data units. The MOVEDATA command can be used with the TEXT command (MOVEDATA is an alternate version of MOVE that uses the coordinates of the most recent plot).

NOTE 2
The CHARACTER AUTOMATIC command with no arguments sets all characters to X.

DEFAULT
No automatic plot characters are used.

SYNONYMS
None
