

LAMPPF**PURPOSE**

Compute the Tukey-Lambda percent point function with shape parameter λ .

DESCRIPTION

The Tukey-Lambda distribution does not have a simple closed formula for the probability density function or the cumulative distribution function. The Tukey-Lambda percent point function is:

$$G(p) = \frac{p^\lambda - (1-p)^\lambda}{\lambda} \quad (\text{EQ 8-251})$$

The input value is a real number between 0 and 1.

SYNTAX

LET <y2> = LAMPPF(<y1>,lambda) <SUBSET/EXCEPT/FOR qualification>

where <y1> is a variable, a number, or a parameter in the range 0 to 1;

<y2> is a variable or a parameter (depending on what <y1> is) where the computed Tukey-Lambda ppf value is stored;

<lambda> is a number or parameter that specifies the shape parameter;

and where the <SUBSET/EXCEPT/FOR qualification> is optional.

EXAMPLES

LET A = LAMPPF(0.9)

LET Y = LAMPPF(P)

DEFAULT

SYNONYMS

None

RELATED COMMANDS

LAMCDF	=	Compute the Tukey-Lambda cumulative distribution function.
LAMPDF	=	Compute the Tukey-Lambda probability density function.
LAMSF	=	Compute the Tukey-Lambda sparsity function.
NORPDF	=	Compute the standard normal probability density function.
NORCDF	=	Compute the standard normal cumulative distribution function.
NORPPF	=	Compute the standard normal percent point function.
LOGCDF	=	Compute the logistic cumulative distribution function.
LOGPDF	=	Compute the logistic probability density function.
LOGPPF	=	Compute the logistic percent point function.
UNICDF	=	Compute the uniform cumulative distribution function.
UNIPDF	=	Compute the uniform probability density function.
UNIPPF	=	Compute the uniform percent point function.
