## CORRELATION MATRIX

## PURPOSE

Compute the correlation matrix of a matrix.

## DESCRIPTION

The correlation matrix computes the correlation coefficients of the columns of a matrix. That is, row $i$ and column $j$ of the correlation matrix is the correlation between column $i$ and column $j$ of the original matrix. The diagonal elements of the correlation matrix will be 1 since they are the correlation of a column with itself. The correlation matrix is also symmetric since the correlation of column i with column j is the same as the correlation of column j with column i .

## SYNTAX

LET <mat2> = CORRELATION MATRIX <mat1> <SUBSET/EXCEPT/FOR qualification>
where <mat1> is a matrix for which the correlations are to be computed;
<mat2> is a matrix where the resulting correlations are saved;
and where the <SUBSET/EXCEPT/FOR qualification> is optional and rarely used in this context.

## EXAMPLES

LET C = CORRELATION MATRIX A

## DEFAULT

None

## SYNONYMS

None

## RELATED COMMANDS

CORRELATION $=\quad$ Compute the correlation of two variables.
VARIANCE-COVA MATRIX $=$ Compute the variance-covariance matrix of a matrix. PRINCIPAL COMPONENTS $=$ Compute the principal components of a matrix.

## APPLICATIONS

Linear Algebra

## IMPLEMENTATION DATE

87/10

## PROGRAM

DIMENSION 100 COLUMNS; SKIP 25; COLUMN LIMITS 20132
READ AUTO79.DAT Y1 TO Y12
LET N = SIZE Y1
LET X = MATRIX DEFINITION Y7 N 6
LET C = CORRELATION MATRIX X
PRINT C
This command generates the following output.

$$
\begin{array}{cc}
\text { MATRIX C } & --\quad 6 \text { ROWS } \\
-- & 6 \text { COLUMNS }
\end{array}
$$
