NBCDF

PURPOSE
Compute the negative binomial cumulative distribution function.

DESCRIPTION
The negative binomial distribution is used when there are exactly two mutually exclusive outcomes of a trial. These outcomes are often called success and failure. The negative binomial probability distribution is the probability of obtaining the kth success on the xth trial (the binomial distribution is the probability of x successes in n trials). It has the following cumulative distribution function:

$$\text{nbcdf}(x, p, k) = \sum_{i=0}^{x} \binom{i-1}{k-1} p^k (1-p)^{(i-k)} \qquad \textbf{(EQ 8-271)}$$

where p is the probability of a success on a single trial. The combinatorial function of i-1 things taken k-1 at a time has the formula:

$$\binom{i-1}{k-1} = \frac{(i-1)!}{(k-1)!((i-1)-(k-1))!} \qquad \textbf{(EQ 8-272)}$$

SYNTAX
LET <y2> = NBCDF(<y1>,<p>,<k>)   <SUBSET/EXCEPT/FOR qualification>
where <y1> is a non-negative integer variable, number, or parameter specifying the number of trials;
    <y2> is a variable or a parameter (depending on what <y1> is) where the computed negative binomial cdf value is stored;
    <p> is a number or parameter between 0 and 1 that is the probability of success on a single trial;
    <k> is the number of successes;
and where the <SUBSET/EXCEPT/FOR qualification> is optional.

EXAMPLES
LET A = NBCDF(10,0.5,3)
LET Y = NBCDF(X1,0.3,25))

DEFAULT
None

SYNONYMS
None

RELATED COMMANDS
NBPDF	=	Compute the negative binomial probability density function.
NBPPF	=	Compute the negative binomial percent point function.
BINCDF	=	Compute the binomial cumulative distribution function.
BINPDF	=	Compute the binomial probability density function.
BINPPF	=	Compute the binomial percent point function.
POIPDF	=	Compute the Poisson probability density function.
POICDF	=	Compute the Poisson cumulative distribution function.
POIPPF	=	Compute the Poisson percent point function.
GEOCDF	=	Compute the geometric cumulative distribution function.
GEOPDF	=	Compute the geometric probability density function.
GEOPPF	=	Compute the geometric percent point function.
